

## **IEEE Transactions on Energy Markets, Policy, and Regulation**

Market forces, new energy policies and evolving regulatory practices have an increasing influence on the operation and development of power and energy systems. To keep its membership abreast of these new developments, the Power and Energy Society has launched a new journal: the IEEE Transactions on Energy Markets, Policy, and Regulation.

As its name suggests, this rigorously peer-reviewed journal will publish articles discussing economic, policy, and regulatory frameworks to support the decarbonization of the electricity supply, as well as the development of a grid that can support the electrification of the demand for energy. Papers discussing these issues from an industry or government perspective or in the context of developing countries are especially encouraged. As with any IEEE Transactions, articles must be supported by detailed engineering, economic, or policy analyses and assessments.

These transactions aim to be the place where people who work on energy issues from the economics, engineering, and regulatory perspectives meet to develop better solutions.

For a detailed list of the topics within the scope of these transactions, please refer to:
